The cybercrime or software that allows a hacker to break into your devices and move around undetected, became the weapons arms race. One of the most coveted tools used by world leaders to destroy the opponents. Use cyber weapons to destroy the enemy by destroying the transport system communication system power system shutdown as a result, the country came to a halt causing the collapse of the trading system and cause loss to the bank's financial condition. This book consisted of seven parts and twenty-three chapters. In part I (Chapter 1–2), the author mentions a deciding to do research on the secretive industry in the cyber arms race and travelling to meetings and access to research contributors. In part II (Chapter 3–5), the author mentions information that has been exposed by hackers trying to break into applications or programs of large corporations with product launches and communication products and discusses the forms, methods and places where cyber weapons are made. In part III (Chapter 6–10), the author describes a country that uses cyber weapons to attack its competitors, since the destruction of the computer system communication system transportation system, energy system, security forces of the country weapons storage system, including spying applications online on various websites to wait for the moment to attack. In part IV (Chapter 11–13), about interviews with hackers and freelancers on government digital hacks, industrial organization and the global website system to destroy such systems. In part V (Chapter 14–16), about interviews with corporate security teams and agencies in preventing data hacking and hacker revenge and the creation of a superior security system. In part VI (Chapter 17–19), about building grid technology to counteract the country's sabotaging cyberattack. In part VII (Chapter 20–23), about the repercussions were more intense than before, when a security team builds a strong defence system Hackers have always been able to create superior hacking and surveillance systems. My opinion of this book is a very good book that introduces everyone to the severity of threats, destruction and theft of electronic information via the internet. In the future, the information about the section, whether private work information, financial transactions communication including various history collections are recorded through intranets and big data networks in the form of big data. Therefore, the lessons from this book will make every sector aware of data security or will find a way to store information in other forms than electronic systems, so which format is suitable?
